Lab 3: Django Views, URLs, and Templates

Student Name: Lujain Aljuraybia | Student ID: 432205249
GitHub Repository: github.com/lujain157/CS471-Labs

Overview

This lab practices Django views, URL routing, URL and query parameters, templates, template variables, and dynamic display of book information.

Task 1 — Basic View and Query Parameter

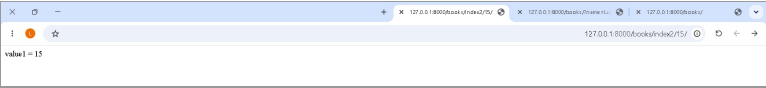

Default output: "Hello, world!"

Output with ?name=Lujain query parameter

The view reads the `name` query parameter and shows a default value when no name is supplied.

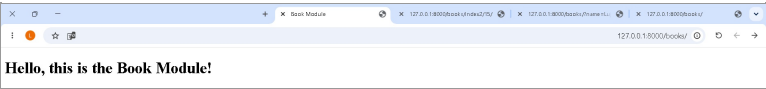

Task 2 — URL Integer Parameter

index2/15/ returns value1 = 15

An integer value is passed through the URL path to the Django view.

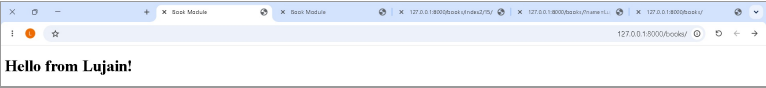

Task 3 — Book Module Template

Book Module rendered via HTML template

The Book Module view was rendered using an HTML template.

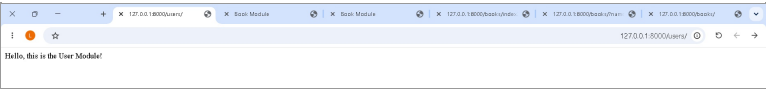

Task 4 — Template Variable

Template variable output: "Hello from Lujain!"

Data was passed from the Django view to the HTML template using a context variable.

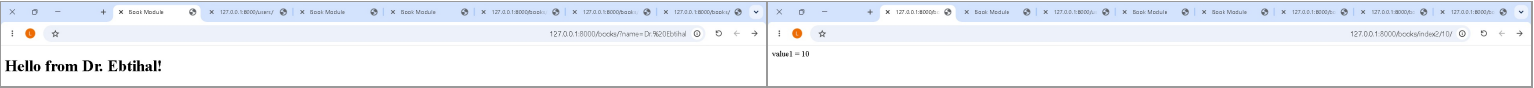

Task 5 — User Module

User Module accessed via its URL

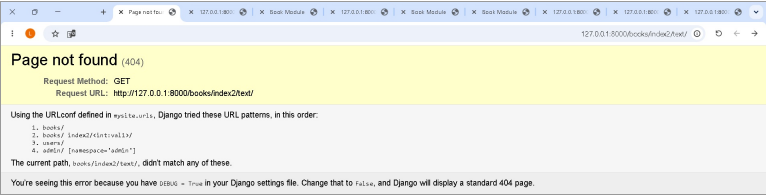

The User Module was configured and accessed through its own URL route.

Task 6 — URL and Parameter Testing

?name=Dr. Ebtihal query parameter

index2/10/ returns value1 = 10

index2/text/ does not match <int:val1> — 404 Not Found

The URL pattern uses `<int:val1>`, so integer values are accepted while text input does not match the pattern and returns a 404 response.

Task 7 — Display Book Details

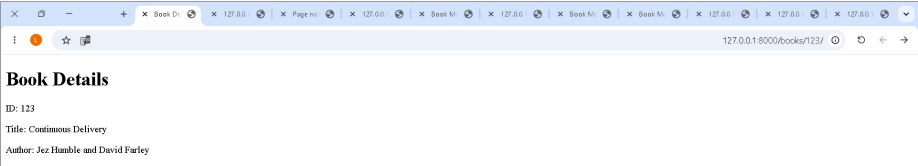

Figure: Book Details for ID 123 — Continuous Delivery by Jez Humble and David Farley

The book ID is received from the URL, the matching book is selected in the view, and its details are passed to `show.html` and displayed using Django template variables.

Steps Performed

- Created Django views and configured URL patterns for each task.
- Used query parameters and integer URL parameters (`<int:val1>`).
- Created HTML templates and passed data using context variables.
- Configured and tested the User Module route.
- Tested URL converters, confirming correct 404 handling for invalid input.
- Displayed book details dynamically based on the URL-provided book ID.

Conclusion

The lab successfully demonstrated Django views, URL routing, URL and query parameters, templates, context variables, and dynamic content rendering.
