Lab 2: Django Project Setup

Student Name: Lujain Aljuraybia
Student ID: 432205249

Overview

This lab covered setting up a Python virtual environment, installing Django, creating a Django project and two apps, running the development server, applying database migrations, and uploading the project to GitHub.

Screenshot 1 — Django Development Server

Figure 1: Django Development Server Running Successfully

Screenshot 2 — Database Migrations

Figure 2: Successful Django Database Migrations

Steps Performed

- Created a Python virtual environment named `djangoenv`.
- Installed Django and verified the installation.
- Created a Django project named `mysite`.
- Created an `apps` folder inside the project.
- Created two apps inside `apps`: `bookmodule` and `usermodule`.
- Ran the Django development server successfully.
- Executed `python manage.py migrate`; all migrations applied successfully.
- Configured a `.gitignore` file for the project.
- Used Git and GitHub to upload the project to the course public repository.

Django Project Structure

The project follows this structure:

- `mysite/` — main Django project folder
- `apps/bookmodule/` — Django app
- `apps/usermodule/` — Django app
- `manage.py` — project management script

Git / GitHub Repository Setup

A `.gitignore` file was configured for the project, and the project was pushed using Git to the public GitHub repository designated for the course.

Conclusion

The Django environment was set up, the project and apps were created, the server ran successfully, migrations were applied, and the work was uploaded to GitHub.
